FLARE GAS MITIGATION SOLUTIONS

Gas flaring is a major economic and environmental loss that releases toxic components and greenhouse gases into the atmosphere, which can have harmful effects on the health and well-being of local communities and contribute to climate change. Our solutions offer capturing and monetization of associated gas that would normally be flared, transforming it into useful energy or product.

The majority of flaring occurs at either aging and/or remote installations typically located within 10 miles of existing pipelines. Bringing associated gas to customers via a connection to an existing gas network, or directly to any site if possible, is clearly a preferable way to avoid flaring.

CNG Delivery offers a flexible structure for flare gas capture, processing and compression, providing customers a reliable supply of clean, cost effective natural gas to help support Environmental, Social and Governance (“ESG”) best practices and waste minimization.

WE PROVIDE ECONOMIC FLARE GAS CAPTURE FOR REMOTE:

- Power Generation
- Dual-fuel and Electric Hydraulic Fracturing
- Green Crypto Currency Mining
- Fleet Fueling Consumption
- Insertion into pipeline or wells for oil recovery

In 2020, the World Bank estimated 5.3 trillion cubic feet of natural gas are flared or vented annually, highest in a decade.

The approximate cost of flared natural gas is over \$30B.

It is Equivalent to 25% of the United States' yearly gas consumption.

More than 400 million tons of carbon dioxide equivalent are emitted into the atmosphere annually.
